Thermally Assisted Pet Dish

Abstract

A thermally assisted pet dish whereby a substance is either heated or frozen to assist in the prevention of spoilage, A easily removable non-skid ring allows access for the regeneration, replacement or substitution of the substance as needed and retains the bottom where the weight is evenly distributed such that the dish is not easily over turned. Inside the vessel the insulation is placed such that BTU's from the conditioning source or sources is redirected towards the refreshment and its longevity is dramatically increased by the prevention of the BTU's escape from within the vessel.
